

BSK800 PEELING KIT CHEMICAL PEELING KIT

DESCRIPTION

BSK800 is a professional kit for treating all skin types. It is a treatment for correcting skin discoloration associated with melanin pigmentation disorders. It renews the epidermis, removing the middle layers of the skin, helping to regenerate new tissue and eliminate pigmentary discoloration and actinic disorders.

The treatment can be used on all patients with hyperpigmentation, melasma, or other skin discoloration, as well as on acne-prone skin, to reduce seborrhea and treat acne.

The treatment to be followed depends on the desired result for each skin type. Use BSK87 for a shiny finish or BSK81 for acne-prone skin.

PRECAUTIONS

Store between 5°C and 25°C.
Keep out of reach of children. Avoid contact with eyes and mucous membranes.

Discontinue use if allergy, sensitivity, or hypersensitivity occurs.

It's important for the physician to be familiar with the chemical characteristics, indications, and properties, as well as the mechanism of action of the different acids, in order to correctly select the treatment and exposure times, taking into account skin type and phototype.
